

# MONOMATIC

SELF-CONTAINED,  
ELECTRICALLY OPERATED  
SANITATION SYSTEM

## MONOCHEM

## T-5

CHEMICAL TREATMENT

A CHEMICAL TREATMENT  
FOR USE WITH  
THE MONOMATIC  
SANITATION SYSTEM

### SUPPLEMENTARY CHEMICAL INSTRUCTIONS

To charge your Monomatic sanitation system, we suggest adding one package of Monochem T-5 chemical treatment to four gallons of water for standard 80-use Monomatic sanitation systems (3 gallons for 50-use Mini-Monomatic sanitation systems). Many variables, such as weather and amount of travel, affect the potency of Monochem T-5 chemical treatment, particularly the extent of color control. For this reason, you may find that for less or more extensive use you will want to regulate the amount of Monochem T-5 chemical treatment for maximum performance.

1. As an initial charge for two days you might, for example, want to try using one-half package, then adding the balance at the beginning of the third day.
2. Fold bag, containing unused portion, several times and seal with scotch tape, etc., in order to maintain full effectiveness.
3. Experience with your Monomatic sanitation system, under your own particular conditions, will quickly allow you to select the proper charge for best results.

Note: Monomatic sanitation system warranty does not cover use of any chemical other than Monochem T-5 chemical treatment "or an equivalent which is not harmful or injurious to the tank and bowl, housing, motor, drive, gears, and all other moving parts."
